WIF Desk — BD Team Trial Guide

Bot: @grokfomotrading_bot · Chain: Robinhood Chain (EVM, chain ID 4663) · Mode: PAPER trading (virtual cash, no real funds)

1. Start the bot

Open the bot link above and tap Start (or send /start).

You'll get: WIF Desk online. Robinhood Chain trading agent. Commands: /scan /status /trade /portfolio /practice /mode

2. Run a scan

/scan

The Scanner agent pulls live Robinhood Chain tokens (DexScreener + on-chain pool logs) and feeds them through the full pipeline: Scanner → Auditor → Analyst → Executor → Risk.

You'll see a numbered list, e.g. 1. Robinhood (ROBINHOOD) — 0x008Df4... 2. Robinhood (ROBINHOOD) — 0x79Fe86...

3. Set up your practice wallet

/practice — resets your virtual balance to $1,000.

You can also set a custom amount: /practice 5000

4. Buy a token

Use the number from the /scan list: /trade 1 50

Or use a percentage of your cash: /trade 1 25%

The Auditor (contract / liquidity / pool age / holders) and Analyst (alive / organic / flush / chase score) run before the trade. If a token fails the gates, the bot tells you why. Add force to override: /trade 1 50 force

After buying you'll see buttons: Close 15% · Close 50% · Close All · View on DexScreener

5. Manage positions

· Close part of a trade — tap Close 15%, Close 50%, or Close All

· Close by command — /close 1 (100%) or /close 1 50 (50%)

· View portfolio — /portfolio (cash + open positions)

· View PnL — /pnl (report + bar-chart image of every trade)

6. Other commands

Command	What it does
/scan	Scan for tokens, run the full pipeline
/status	Tokens scanned, mode, recent tokens
/mode	Show/set mode (/mode paper or /mode live)
/practice	Reset virtual cash
/trade	Buy by number/address, custom size
/close	Close a position (optionally partial)
/portfolio	Cash + open positions
/pnl	PnL report + chart
/pause /resume	Pause/resume trading

7. How the 5-agent pipeline works

1. Scanner — finds new tokens on Robinhood Chain

2. Auditor — 4-layer safety check (contract, liquidity, pool age, top holders)

3. Analyst — scores momentum/organic activity (rules-based)

4. Executor — sizes the position, pushes Buy/Skip to Telegram

5. Risk — stop-loss (6%), trailing stop (12% after +20%), timeout (3h), PnL exits

Every trade is paper-only. No real funds move.

8. Notes

· Your wallet/positions are stored server-side and survive restarts.

· Trade alerts are broadcast to everyone who /starts the bot.

· The bot runs on Robinhood Chain mainnet data.

· Built for the World is Flat Hackathon (Agents & AI category).
